This baby dinosaur is a type of titanosaur. It lived 80 million years ago. Palaeontologists found its remains at a famous site called Auca Mahuevo, in Argentina. The baby dinosaur bones and scaly skin were found fossilised inside fossil eggs. The eggs were laid at this ancient nesting ground by generations of titanosaurs herds. Each mother titanosaur laid 15 to 40 eggs in a shallow nest scraped into the ground. The eggs were almost round and about 14 centimetres across.
